Your current grade on this assignment is: 100%
```

Extracting Data from JSON

In this assignment you will write a Python program somewhat similar to http://www.py4e.com/code3/json2.py 2. The program will prompt for a URL, read the JSON data from that URL using **urllib** and then parse and extract the comment counts from the JSON data, compute the sum of the numbers in the file and enter the sum below:

We provide two files for this assignment. One is a sample file where we give you the sum for your testing and the other is the actual data you need to process for the assignment.

- Sample data: http://py4e-data.dr-chuck.net/comments_42.json

 ☐ (Sum=2553)
- Actual data: http://py4e-data.dr-chuck.net/comments_703287.json [2] (Sum ends with 54)

You do not need to save these files to your folder since your program will read the data directly from the URL.

Note: Each student will have a distinct data url for the assignment - so only use your own data url for analysis.

Data Format

The data consists of a number of names and comment counts in JSON as follows:

The closest sample code that shows how to parse JSON and extract a list is json2.py . You might also want to look at geoxml.py . to see how to prompt for a URL and retrieve data from a URL.

Sample Execution

Seleccionar idioma

Ptecho Enter location: http://py4e-data.dr-chuck.net/comments_42.json Retrieving http://py4e-data.dr-chuck.net/comments_42.json Retrieved 2733 characters Count: 50 Sum: 2	
Turning in the Assignment	
Enter the sum from the actual data and your Python code below:	
Sum: (ends with 54) Submit Assignment	
Python code:	7
